PROVISIONAL SPECIFICATION

Applicant(s) :

UNISEARCH LIMITED
A.C.N. 000 263 025

Invention Title:

METHOD FOR PREPARING COMPOUNDS COMPRISING CUCURBITURIL
GROUPS

The invention is described in the following statement:

METHOD FOR PREPARING COMPOUNDS COMPRISING CUCURBITURIL
GROUPS

FIELD OF THE INVENTION

5 The present invention relates to a method for preparing compounds comprising a plurality of cucurbituril groups.

BACKGROUND TO THE INVENTION

10 Cucurbiturils are a class of macrocyclic compounds based on oligomers of glycoluril or glycoluril analogues.

"Cucurbituril" is the name given to the cyclic oligomer formed by linking six (6) glycoluril molecules via methylene bridges. However, the term "cucurbituril" has
15 also been used, and is used in this specification, to refer to a class of compounds. To avoid confusion, the compound cucurbituril is referred to in this specification as "unsubstituted cucurbit[6]uril".

20 Unsubstituted cucurbit[6]uril was first described in the literature in 1905 in a paper by R. Behrend, E. Meyer and F. Rusche, Leibigs Ann. Chem., 339, 1, 1905. The macrocyclic structure of unsubstituted cucurbit[6]uril was first described in 1981 by W.A. Freeman et. al.,
25 "Cucurbituril", J. Am. Chem. Soc., 103 (1981), 7367-7368. Unsubstituted cucurbit[6]uril has a chemical formula of $C_{36}H_{36}N_{24}O_{12}$ and is a macrocyclic compound having a central cavity.

30 The substituted cucurbituril decamethylcucurbit[5]uril was first synthesised and identified in 1992 by Flinn et. al., Angew. Chem. Int. Ed. Engl., 1992, 31, 1475.

Various unsubstituted and substituted cucurbit[4 to
35 12]urils and methods for preparing unsubstituted and substituted cucurbit[4 to 12]urils are described in the applicant's international patent application No.

PCT/AU00/00412 (WO 00/68232), incorporated herein by reference.

5 A class of cucurbit[4 to 20]urils and methods for preparing this class of cucurbit[4 to 20]urils are also described in US patent no. 6,365,734.

10 Cucurbit[n]urils comprise a rigid central cavity with two portals to the central cavity. These portals are surrounded by polar groups and are narrower in diameter than the internal diameter of the central cavity.

15 Various cucurbituril analogues have also recently been described (for example, in Lagona J. et al "Cucurbit[n]uril Analogues", Organic Letters, 2003, Vol 5, No. 20, 3745-3747). These analogues have a similar macrocyclic structure to cucurbit[n]urils and form complexes with other compounds in a similar manner to cucurbit[n]urils. Like cucurbit[n]urils, cucurbituril
20 analogues comprise a rigid central cavity with two portals to the central cavity, the portals being surrounded by polar groups and having a narrower diameter than the internal diameter of the central cavity.

25 Cucurbit[4 to 12]urils and cucurbituril analogues selectively complex various molecules. For example, the central cavity of a cucurbit[4 to 12]uril or a cucurbituril analogue selectively encapsulates gases and volatile molecules. Cucurbit[4 to 12]urils and
30 cucurbituril analogues can also selectively form complexes with molecules at the polar ends of the central cavity.

35 Cucurbit[4 to 12]urils and cucurbituril analogues can be used to form complexes with, and then later release, gases, volatiles, and other molecules. These properties give cucurbit[4 to 12]urils and cucurbituril analogues a wide variety of uses. These uses include for example:

- entrapment and removal of pollutants,
 - use as odourisers, releasing fragrances slowly over time,
 - to trap unpleasant odours or toxic vapours, and
 - chemical purification or separation techniques, for
- 5 example, in chromatographic columns.

These uses of cucurbiturils and cucurbituril analogues involve forming a complex of the cucurbituril or cucurbituril analogue with another molecule. Typically

10 the complex is formed by contacting the cucurbituril or cucurbituril analogue with the molecule by moving a gas or liquid containing the molecule past the cucurbituril or cucurbituril analogue. However, in many cases, some of the cucurbituril or cucurbituril analogue molecules are

15 lost during this process, either by being physically blown or washed away by the movement of the gas or liquid past the cucurbituril or cucurbituril analogue or by the cucurbituril or cucurbituril analogue dissolving in the liquid and being washed away with the liquid.

20.

SUMMARY OF THE INVENTION

The present inventors have sought to develop a method for preparing compounds comprising multiple cucurbituril

25 groups. A compound comprising multiple cucurbituril groups is, due to the size of the compound, generally less susceptible to being physically blown or washed away by the movement of a gas or liquid than a smaller cucurbituril or cucurbituril analogue molecule comprising

30 a single cucurbituril group. Further, because of the high molecular weight of such a compound, if the compound dissolves in a liquid, an artificial or biological membrane or film can be used to retain the compound in a given environment in the liquid.

35

A compound comprising a plurality of cucurbituril groups can be prepared by preparing cucurbiturils or cucurbituril

analogues and then linking the cucurbiturils or cucurbituril analogues using reactions known in the art for linking organic molecules. For example, two cucurbiturils or cucurbituril analogues may be linked by a
5 condensation reaction between appropriate substituents on the cucurbiturils or cucurbituril analogues. However, this process involves the step of first forming the cucurbiturils or cucurbituril analogues and then the
10 separate step of linking the formed cucurbiturils or cucurbituril analogues.

It would be advantageous to provide an alternative method for preparing compounds comprising a plurality of cucurbituril groups.

15 The present inventors have now found an alternative method for preparing compounds comprising a plurality of cucurbituril groups.

20 In one aspect, the present invention provides a method for preparing a compound comprising a plurality of cucurbituril groups, the method comprising the steps of:

25 (a) forming a mixture comprising one or more compounds of the formula (1)

wherein

30 L is a linking group; and
each A is independently selected and is a group of the formula (A)

(A)

wherein:

5 for each unit of the formula (B)

(B)

in formula (A),

- 10 R^1 and R^2 may be the same or different, and are each independently selected from a bond with L or a univalent radical, or
- 15 R^1 , R^2 and the carbon atoms to which they are bound together form an optionally substituted cyclic group, or
- R^1 of one unit of the formula (B) and R^2 of an adjacent unit of the formula (B) together form a bond

or a divalent radical,

and

each R^3 is independently selected from the group consisting of $=O$, $=S$, $=NR'$, $=CXZ$, $=CZR'$, $=CXR''$ and $=CZ_2$, wherein Z is an electron withdrawing group, R' is selected from the group consisting of a bond with L , H , an optionally substituted straight chain, branched or cyclic, saturated or unsaturated hydrocarbon radical, or an optionally substituted heterocyclyl radical, and R'' is a bond with L ; and

each R^5 is independently selected from the group consisting of H , alkyl and aryl;

R^7 and R^8 may be the same or different and are independently selected from the group consisting of H and $-CHR^5OR^5$, or R^7 and R^8 together form the group $-CHR^5-O-CHR^5-$, where each R^5 is independently selected and is as defined above;

R^9 and R^{10} may be the same or different and are independently selected from the group consisting of H and $-CHR^5OR^5$, or R^9 and R^{10} together form the group $-CHR^5-O-CHR^5-$, where each R^5 is independently selected and is as defined as above; and

x is 0 or an integer from 1 to 10, typically x is 0, 1, 2, 3 or 4;

provided that at least one R^1 or R^2 is a bond with L or at least one R^3 is $=NR''$, $=CZR''$ or $=CXR''$ where R'' is a bond with L ;

and an acid; and

(b) exposing the mixture to conditions effective for at least some of the groups A to react to form cucurbituril groups, wherein at least some of the cucurbituril groups

formed are formed from a group A of one molecule of the formula (1) and a group A of another molecule of the formula (1), thereby forming a compound comprising a plurality of cucurbituril groups.

5

R^1 and R^2 may be the same or different in different units of the formula (B) in formula (A).

10

Z may for example be $-\text{NO}_2$, $-\text{CO}_2\text{R}$, $-\text{COR}$ or $-\text{CX}_3$, wherein X is halo and R is H, an optionally substituted straight chain, branched or cyclic, saturated or unsaturated hydrocarbon radical or an optionally substituted heterocyclyl radical.

15

Typically R^5 is H. Typically R^3 is =O.

20

Typically, the mixture further comprises one or more compounds capable of linking two groups A ("an Additional Compound"), and wherein at least some of the cucurbituril groups are formed from a group A of one molecule of the formula (1), a group A of another molecule of the formula (1) and one or more of the Additional Compounds.

25

Typically, the Additional Compound is a compound of the formula (2):

(2)

wherein for each unit of the formula (B)

(B)

5

in the compound,

R¹ and R² may be the same or different, and are each a univalent radical, or

10 R¹, R² and the carbon atoms to which they are bound together form an optionally substituted cyclic group, or R¹ of one unit of the formula (B) and R² of an adjacent unit of the formula (B) together form a bond or a divalent radical, and

15 each R³ is independently selected from the group consisting of =O, =S, =NR, =CXZ, =CRZ and =CZ₂, wherein Z is an electron withdrawing group such as -NO₂, -CO₂R, -COR or -CX₃, X is halo, and R is H, an optionally substituted straight chain, branched or cyclic, saturated or
20 unsaturated hydrocarbon radical, or an optionally substituted heterocyclyl radical;

each R⁵ is independently selected from the group consisting of H, alkyl and aryl;

25

R¹¹ and R¹² may be the same or different and are independently selected from the group consisting of H and

-CHR⁵OR⁵, or R¹¹ and R¹² together form the group -CHR⁵-O-CHR⁵-, where each R⁵ is independently selected and is as defined above,

5 R¹³ and R¹⁴ may be the same or different and are independently selected from the group consisting of H and -CHR⁵OR⁵, or R¹³ and R¹⁴ together form the group -CHR⁵-O-CHR⁵-, where each R⁵ is independently selected and is as defined as above; and

10 y is 0 or an integer from 1 to 9; typically y is 0, 1 or 2.

R¹, R² and R⁵ may be the same or different in different
15 units of the formula (B) in formula (2). Typically R⁵ is H. Typically R³ is =O.

In some embodiments of the present invention, the
Additional Compound is a bis-hydrazine compound of the
20 formula (6):

(6)

wherein R¹¹, R¹², R¹³ and R¹⁴ are as defined above for
25 formula (2); typically R¹¹ to R¹⁴ are each H.

If the groups A in the compound or compounds of formula
(1) in the mixture on average comprise one to two units of
the formula (B), the mixture typically comprises one or
30 more Additional Compounds.

Step (b) of the method of the present invention typically
comprises heating the mixture to a temperature of from

20°C to 120°C.

In some embodiments of the present invention, step (b) further comprises contacting the one or more compounds of formula (1) with a compound that can form bridges between groups A, or between a group A and an Additional Compound. Typically the one or more compounds of the formula (1) is contacted with such a compound by incorporating the compound into the mixture comprising the one or more compounds of the formula (1) and the acid.

Typically the compound that can form bridges between groups A, or between a group A and an Additional Compound, is a compound of the formula R^5COR^5 where R^5 is as defined above and each R^5 is independently selected, a compound of the formula $R^5OC(R^5)_2OR^5$ where R^5 is as defined above and each R^5 is independently selected, trioxane, optionally substituted 3,4-dihydropyran or optionally substituted 2,3-dihydrofuran. These compounds are capable of forming bridges of the formula $-CHR^5-$ between groups A, and between a group A and a compound of formula (2) or (6). As will be apparent to a person skilled in the art, these compounds form bridges of the formula $-CHR^5-$ between groups A, and between a group A and a compound of formula (2) or (6), by reaction with, or replacement of, the groups R^7 to R^{14} to form bridges of the formula $-CHR^5-$ bound to the nitrogen atoms to which R^7 to R^{14} were bound.

As will be apparent to a person skilled in the art, in some embodiments of the invention, it is not necessary to include a compound that can form bridges between groups A, or between a group A and an Additional Compound, in the mixture in order to form cucurbituril groups in step (b) of the method of the present invention. For example, if all the groups R^7 , R^8 , R^9 , R^{10} , R^{11} , R^{12} , R^{13} and R^{14} in the compounds of formula (1) and the Additional Compounds of formula (2) or (6), if any, in the mixture are other than

H, the groups A can react with each other and with the Additional Compounds of formula (2) and (6), if any, in step (b) of the method of the present invention to form cucurbituril groups without the presence of such a compound. However, if all of the groups R^7 , R^8 , R^9 , R^{10} , R^{11} , R^{12} , R^{13} and R^{14} are H, then such a compound must be included in the mixture in order for the groups A to react with each other and with the Additional Compounds of formula (2) or (6), if any, to form cucurbituril groups in step (b) of the method.

Typically, if the molar ratio of the groups R^7 , R^8 , R^9 , R^{10} , R^{11} , R^{12} , R^{13} and R^{14} in the compounds of formula (1), (2) and (6) in the mixture which are H to those which are not H is greater than 1, then a compound that can form bridges of the formula $-CHR^5-$ between groups A, and between a group A and a compound of formula (2) or (6), is included in the mixture.

The mixture comprising the one or more compounds of formula (1) and the acid may be prepared by adding the one or more compound of the formula (1) to the acid and mixing. If the mixture further comprises other components, such as one or more Additional Compounds or one or more compounds that can form bridges between groups A, or between a group A and an Additional Compound, the mixture may be prepared by combining the various components of the mixture in any order.

The linking group L can be any group capable of linking to two groups A. L is typically a divalent group linking two groups A. However, in some embodiments, the group L may have more than one bond to one or both of the groups A. The linking group may for example be an organic group such as a hydrocarbon chain or a polymer chain, or a metal or metal complex. L is typically a polymer or other organic group. The linking group L can be as short as $-CH_2-$, $-O-$ or

-NH-, or as long as a polymer chain.

Typically the group A is bound to the linking group L via a bond at one R¹ or R² in the group A (i.e. one R¹ or R² in formula (A) is a bond with L), or by a bond at both R¹ and R² in one unit of the formula (B) in the group A (i.e. both R¹ and R² in one unit of the formula (B) in formula (A) are each a bond with L). However, in some embodiments of the present invention, the group A is bound to the linking group L by a bond at R⁵ or R³ (i.e. one R⁵ in formula (A) is a bond with L, or one R³ in formula (A) is =NR", =CXR" or =CZR" where R" is a bond with L).

In some embodiments, the linking group L comprises one or more further groups A. For example, the group L may comprise a polymer chain which is substituted by one or more groups containing groups of the formula (A).

In another aspect, the present invention provides a compound comprising a plurality of cucurbituril groups prepared by the method of the present invention.

DEFINITIONS

Having regard to the cucurbiturils described in WO 00/68232 and US patent no. 6,365,734 and the inventors' further work, the class of cucurbiturils is broader than that described in either of WO 00/68232 or US patent no. 6,365,734.

As used herein, the term "cucurbituril" refers to a compound of the formula (C):

(C)

wherein:

for each unit of the formula (D):

(D)

- 15 in the compound,
 R^1 and R^2 may be the same or different, and
 are each a univalent radical, or
 R^1 , R^2 and the carbon atoms to which they are bound
 together form an optionally substituted cyclic group, or
 20 R^1 of one unit of the formula (D) and R^2 of an adjacent
 unit of the formula (D) together form a bond or a divalent
 radical,
 each R^3 is independently selected from the group consisting
 of =O, =S, =NR, =CXZ, =CRZ, and =CZ₂, wherein Z is an
 25 electron withdrawing group such as -NO₂, -CO₂R, -COR or -
 CX₃, X is halo and R is H, an optionally substituted
 straight chain, branched or cyclic, saturated or
 unsaturated hydrocarbon radical, or an optionally

substituted heterocyclyl radical, and each R^5 is independently selected from the group consisting of H, alkyl and aryl;

- 5 and n is the degree of polymerisation, that is, the number of units of the formula (D) in the compound.

To differentiate various cucurbiturils, the inventors have adopted the term "cucurbit[n]uril", where n is the degree
10 of polymerisation of the cucurbituril, that is, the number of units of the formula (D) in the macrocyclic ring of the cucurbituril. For example, a cucurbituril comprising eight units of the formula (D) joined together would be denoted as cucurbit[8]uril.

15

Unless otherwise specified, the terms "cucurbituril" and "cucurbit[n]uril" as used herein refer to a cucurbit[n]uril where n is an integer from 4 to 12.

- 20 As used herein, the terms "unsubstituted cucurbituril" and "unsubstituted cucurbit[n]uril" refer to a cucurbituril in which R^3 is =O, and R^1 , R^2 and R^5 are H, in all the units of formula (D) in the cucurbituril. As used herein, the terms "substituted cucurbituril" and "substituted
25 cucurbit[n]uril" refer to a cucurbituril other than an unsubstituted cucurbituril.

- As used herein, the term "cucurbituril analogue" refers to a compound comprising a macrocyclic ring similar to the
30 macrocyclic ring of a cucurbit[n]uril such that the macrocyclic ring comprises a rigid central cavity with two portals to the central cavity, the portals being surrounded by polar groups and having a narrower diameter than the internal diameter of the central cavity, and
35 wherein the compound is capable of forming complexes with other molecules in the same or substantially the same manner as a cucurbit[n]uril. A cucurbituril analogue may

for example, have the basic cyclic structure of a cucurbituril of the formula (C) as defined above, but in which one or some, but not all, of the units of the formula (D) are replaced by another group such as a group of the formula:

As used herein, the term "cucurbituril group" refers to the macrocyclic ring of a cucurbituril or cucurbituril analogue, the macrocyclic ring comprising a rigid central cavity with two portals to the central cavity, the portals being surrounded by polar groups and having a narrower diameter than the internal diameter of the central cavity.

As used herein, the term "cucurbit[n]uril group" refers to a cucurbituril group having the cyclic structure shown in formula (C) above, that is, that part of formula (C) excluding the groups R^1 , R^2 , R^5 and R .

As used herein, the term "glycoluril analogue" refers to a compound of the formula (5):

(5)

wherein

R^1 and R^2 may be the same or different, and are each a univalent radical, or

R^1 , R^2 and the carbon atoms to which they are bound

5. together form an optionally substituted cyclic group, and R^3 and R^{11} to R^{14} are as defined above for formula (2).

DETAILED DESCRIPTION OF PREFERRED EMBODIMENTS

10

As will be apparent to a person skilled in the art, in formulas (1) and (2), R^1 and R^2 can be any group that does not prevent the groups A in the one or more compounds of formula (1) reacting to form cucurbituril groups in step
15 (b) of the method of the present invention. The present invention is not limited to methods where R^1 and R^2 are particular groups.

20

In formulas (1), (2) and (5), when R^1 or R^2 is a univalent radical, the univalent radical is typically -R, -OR, -NR₂ where each R is independently selected, -NO₂, -CN, -X,

25

-COR, -COX, -COOR, $\overset{\text{O}}{\parallel}\text{-CR}_2$ where each R is independently

selected, $\overset{\text{NR}}{\parallel}\text{-C-R}$ where each R is independently selected,

30

-SeR, -SiR₃ where each R is independently selected, -SR,

35

-SOR, $\overset{\text{O}}{\parallel}\text{-S-O-R}$, -SO₂R, -S-S-R, -BR₂ where each R is

independently selected, -PR₂ where each R is independently selected,

where each R is independently selected,

5

where each R is independently selected, $-\text{P}^+\text{R}_2$ where each R is independently selected, or a metal or metal complex,

10 wherein R is H, an optionally substituted straight chain, branched or cyclic, saturated or unsaturated hydrocarbon radical, or an optionally substituted heterocyclyl radical, and X is halo.

When R^1 or R^2 is a univalent radical, the univalent radical
15 may for example be H, an optionally substituted alkyl (e.g. methyl, ethyl, propyl, isopropyl, n-butyl, sec-butyl, isobutyl, tert-butyl, etc), optionally substituted alkenyl, optionally substituted alkynyl, optionally substituted heterocyclyl or optionally substituted aryl
20 (e.g. phenyl, naphthyl, pyridyl, furanyl, thiophenyl or pyrazolyl), -OR, -SR or $-\text{NR}_2$.

In some embodiments, R^1 or R^2 is a univalent radical comprising less than 30 carbon atoms. The univalent
25 radical may for example be an alkyl group of 1 to 30 carbon atoms, an alkenyl group of 1 to 30 carbon atoms, a cyclic hydrocarbon group of 5 to 30 carbon atoms, a cyclic group of 4 to 30 carbon atoms with one or more heteroatoms such as O, N or S, an aryl group of 6 to 30 carbon atoms,
30 or an aryl group of 5 to 30 carbon atoms with one or more hetero atoms such as O, N or S.

R^1 or R^2 may for example be an alkoxy group such as methoxy, ethoxy, propyloxy etc. R^1 or R^2 may also be a
35 hydroxy, halo, cyano, nitro, amino, alkylamino or alkylthio radical.

Examples of optionally substituted cyclic groups formed by R^1 , R^2 and the carbon atoms to which they are bound, include optionally substituted saturated or unsaturated cyclic hydrocarbon groups of 5 to 30 carbon atoms, and
5 optionally substituted saturated or unsaturated cyclic groups of 3 to 30, typically 4 to 30, carbon atoms with one or more heteroatoms such as O, N or S. The optionally substituted cyclic group may comprise two or more fused rings.

10

The divalent radical which may link R^1 and R^2 of adjacent units of the formula (B) in formula (A), adjacent units of the formula (B) in formula (2), or adjacent units of the formula (D) in a cucurbit[n]uril, may, for example, be a
15 divalent optionally substituted straight chain or branched, saturated or unsaturated hydrocarbon radical comprising 1 or more carbon atoms. The divalent radical may consist of or contain one or more heteroatoms such as O, N or S.

20

When R or R' is an optionally substituted hydrocarbon radical or an optionally substituted heterocyclyl radical, the hydrocarbon radical or the heterocyclyl radical may be substituted by one or more substituents. Similarly, when
25 R^1 , R^2 and the carbon atoms to which they are bound together form an optionally substituted cyclic group, the cyclic group may be substituted by one or more substituents. The optional substituents can be any group and may for example be an optionally substituted alkyl, an
30 optionally substituted alkenyl, an optionally substituted alkynyl, an optionally substituted heterocyclyl, an optionally substituted aryl, halo (e.g. F, Cl, Br or I), hydroxyl, alkoxyl, carbonyl, acyl halide, nitro, carboxylic acid, carboxylic acid ester, amino, imino,
35 cyano, isocyanate, thiol, thiol-ester, thio-amide, thio-urea, sulfone, sulfide, sulfoxide or sulfonic acid group or a metal or metal complex. The optional substituent may

also be a borane, a phosphorous containing group such as a phosphine, alkyl phosphine, phosphate or phosphoramidate, a silicon containing group or a selenium containing group.

- 5 Typically Z is $-\text{NO}_2$, $-\text{CO}_2\text{R}$, $-\text{COR}$ or $-\text{CX}_3$, where X is halo (F, Cl, Br or I) and R is H, alkyl, alkenyl, alkynyl, aryl, heteroaryl or saturated or unsaturated heterocyclyl.

- 10 In some embodiments of the present invention, R^3 is $=\text{O}$ and R^5 is H in all the units of formula (B) in the compounds of formulas (1) and (2).

- The group L may be any group capable of linking two groups A. L is typically a divalent organic group. L may for
15 example be $-\text{CH}_2-$, $-(\text{CH}_2)_n-$, $-(\text{CHCH})_n-$, $-\text{O}-$, $-\text{NH}-$, $-\text{CH}_2\text{NH}-$, $-\text{CH}(\text{CH}_3)(\text{CH}_2)_n\text{CH}(\text{CH}_3)-$ or $-(\text{CH}_2)_n-\text{N}(\text{CH}_3)\text{CH}_2\text{CH}_2\text{N}(\text{CH}_3)-(\text{CH}_2)_p-$, where n and p are an integer, such as 1, 2, 3, 4, 5, 6, 7 etc. L may also be an organometallic group such as
20 $-\text{CH}_2\text{Si}(\text{R})_2\text{CH}_2-$ where R is H, an optionally substituted straight chain, branched or cyclic, saturated or unsaturated hydrocarbon radical or an optionally substituted heterocyclyl radical. In some embodiments, L is, or comprises, a metal atom and the compound of the
25 formula (1) is a metal complex.

- In preferred embodiments, the Additional Compound is a compound of formula (2). As will be apparent to a person skilled in the art, if the groups R^7 , R^8 , R^9 , R^{10} , R^{11} , R^{12} ,
30 R^{13} and R^{14} in the compounds of formula (1) and (2) in the mixture are other than hydrogen, the groups A can react with each other and with the compounds of formula (2) to form cucurbituril groups in step (b) of the method without the presence of a compound that can form bridges of the
35 formula $-\text{CHR}^5-$ between groups A, and between a group A and a compound of formula (2). However, if all of these groups are H, or if, in the groups A and the compound or

compounds of formula (2) that are to form the cucurbituril group, the total number of these groups which are H is greater than the total number which are not H, then a compound that can form bridges between groups A, and
5 between a group A and a compound of formula (2), must be included in the mixture in order for the groups A, and the one or more compounds of formula (2), to form the cucurbituril group in step (b) of the method.

10 The compound that can form bridges of the formula $-\text{CHR}^5-$ between groups A, and between a group A and a compound of formula (2), is typically a compound of the formula R^5COR^5 or a compound of the formula $\text{R}^5\text{OC}(\text{R}^5)_2\text{OR}^5$, where R^5 is as
15 defined above and each R^5 group is independently selected, trioxane, optionally substituted 3,4-dihydropyran or optionally substituted 2,3-dihydrofuran. The optionally substituted 3,4-dihydropyran or optionally substituted 2,3-dihydrofuran may be substituted by groups such as alkyl, alkenyl, alkynyl, aryl or halo. The compound of
20 the formula R^5COR^5 may for example be formaldehyde.

Typically the mixture further comprises a templating compound. As used herein, the term "templating compound" refers to a compound that affects the relative amount of
25 different sized cucurbituril groups formed in the method of the present invention. For example a templating compound when added to the mixture, may alter the ratio of, say, cucurbit[5]uril groups to cucurbit[6]uril groups, when that ratio is compared with that ratio of
30 cucurbit[5]uril groups to cucurbit[6]uril groups that is formed using a mixture not containing a templating compound or containing a different templating compound, but otherwise reacted under identical conditions.

35 Typically, the templating compound is a salt. However, it has been found that many other compounds can also act as a templating compound.

Any compound that can alter the ratio of different sized cucurbituril groups formed in the method of the present invention can be used as the templating compound. The
5 templating compound may be an organic compound, a salt of an organic compound, or an inorganic compound. Suitable compounds that may be used as a templating compound include ammonium chloride, lithium chloride, sodium
10 chloride, potassium chloride, rubidium chloride, caesium chloride, ammonium bromide, lithium bromide, sodium bromide, potassium bromide, rubidium bromide, caesium bromide, lithium iodide, sodium iodide, potassium iodide, rubidium iodide, caesium iodide, potassium sulfate, lithium sulfate, tetrabutylammonium chloride,
15 tetraethylammonium chloride, 0-carborane, thioacetamide, N-(1-naphthyl) ethylenediamine, 2,2'-biquinoyl, p-bromoaniline, taurine, blue tetrazolium, 2-amino-3-methyl benzoic acid, indol-3-aldehyde, cystine, 4-acetamidoaniline, p-aminophenol, acetamide, 4-
20 aminoacetophenone, 4-dimethylaminobezaldehyde, 2-aminobenzimidazol, bis-(4,4'-bipyridyl)- α,α' -xylene, red phosphorus, and lithium p-toluenesulfonate. The present inventors believe that a large number of other compounds could be suitable for use as templating compounds and
25 therefore the above list should not be considered to be exhaustive. The anions of the acid may also be considered to be a templating compound.

The templating compounds may be added singly to the
30 reaction mixture, or two or more templating compounds may be added to the reaction mixture.

If a salt is used as the templating compound, the salt is preferably a metal halide, ammonium halide, metal sulphate
35 or metal tosylate. It is preferred that the anion of the salt corresponds to the anion of the acid used. For example, where the acid used is hydrochloric acid, a metal

chloride or ammonium chloride is a preferred salt..
Similarly, iodide-containing salts are preferably used
where hydriodic acid is the acid, and bromide-containing
salts are preferably used where hydrobromic acid is used.

5

The acid is preferably a strong mineral acid or a strong
organic acid. In principle, any acid can be used. The
acid acts to catalyse the reactions taking place.

10

Preferred acids include sulfuric acid, hydrochloric acid,
hydrobromic acid, hydriodic acid, deuterated sulfuric
acid, phosphoric acid, p-toluenesulfonic acid, and methane
sulphonic acid. It will be appreciated that this list is
not exhaustive and that any acid that can catalyse the

15

reaction may be used in the method of the present
invention.

20

The mixture may or may not be an aqueous system. When the
mixture is an aqueous system, the acid is preferably
included in the mixture in an amount such that the
concentration of the acid in the mixture is greater than
5M.

25

A solvent may also be added to the mixture. The solvent
may for example be selected from trifluoroacetic acid,
methanesulfonic acid, 1,1,1-trifluoroethanol or an ionic
liquid.

30

Step (b) of the method of the present invention typically
comprises heating the mixture to a temperature of from 20°C
to 120°C for a period of time sufficient to form a compound
comprising a plurality of cucurbituril groups. Typically
the temperature is 60°C to 110°C, most preferably from 80°C
to 110°C. It is preferred that boiling of the mixture is
avoided. Heating under reflux is not required but may be
used.

35

The method of the present invention is described below by reference to certain non-limiting examples.

1. Preparation of Compounds of Formula (1) and (2)

Compounds of formula (1) and (2) may be prepared by a variety of methods.

(a) *Synthesis of Glycoluril Analogues of formula (5)*

Formula (2) encompasses glycoluril analogues of the formula (5) as defined above.

Formula (5) encompasses glycoluril of the formula:

Formula (5) also encompasses substituted glycolurils of the formula:

There are a large number of substituted glycolurils known in the literature. Particular reference is made to the review article by Harro Petersen in Synthesis, 1973, 249-293, which contains a list of about 30 substituted glycolurils. The literature since that article has disclosed several other examples of substituted glycolurils and it is believed that essentially any α - or β -diketone could be used to make a substituted or unsubstituted glycoluril.

Further substituted glycolurils are disclosed in WO 00/68232.

Substituted glycolurils and other glycoluril analogues can be prepared by methods known in the art. For example, substituted glycolurils and other glycoluril analogues can be prepared as described in the review article by Harro Petersen in Synthesis, 1973, 249-293.

Glycoluril analogues can for example be prepared as described in the following reaction schemes:

Scheme 1

Scheme 2

wherein each R^1 , R^2 and R^3 group is independently selected and is as defined above for formula (2), and X is a leaving group such as a halo or a thioether.

The reactions of Scheme 1 may be carried out under the following conditions:

- a) Reaction in water at room temperature for several days;
- b) Reaction in acidic water with or without a cosolvent;
- c) Reaction in a hydrocarbon solvent in the presence of an acid catalyst while water of reaction is removed azeotropically;
- d) Reaction in a hydrocarbon solvent in the presence of a Lewis acid with or without removal of water generated during reaction.

In Scheme 2, the reaction to form the diamine intermediate is carried out in acid water with or without a cosolvent. The reaction of the diamine intermediate to form the glycoluril analogue is carried out under basic conditions. An example of the reaction of Scheme 2 to form a glycoluril analogue where one R^3 is =NH and the other R^3 is =O is described in I.J. Dagley and M. Kony, Heterocycles 1994, 38, 595.

Scheme 1 can, for example, be used to prepare the following substituted glycolurils.

5

In compound 1.2, X is halo.

Compounds of formula (2) in which R^{11} and R^{12} together form the group $-\text{CHR}^5-\text{O}-\text{CHR}^5-$ and R^{13} and R^{14} together form the group $-\text{CHR}^5-\text{O}-\text{CHR}^5-$, can be prepared by mixing a compound of formula (2) in which R^{11} to R^{14} are H, with trioxane, a compound of the formula $(R^5)_2\text{CO}$ or a compound of the formula $R^5\text{OC}(R^5)_2\text{OR}^5$, where R^5 is as defined above and each R^5 is independently selected, and an acid, and heating the mixture to about 20°C to 60°C . Typically, when a strong mineral acid or strong organic acid is used the mixture heated to between 20°C to 40°C . However, if a weaker acid such as trifluoroacetic acid is used, the mixture can be heated to about 60°C .

20

Compounds of the formula (2) in which some or all of R^{11} to R^{14} are $-\text{CHR}^5\text{OR}^5$ can be prepared by reacting a compound of formula (2) in which R^{11} to R^{14} are H with a compound of the formula XHR^5COR^5 , where X is halo and each R^5 is independently selected and is as defined above, under basic conditions. The reaction typically occurs at room temperature, but the reaction mixture can be heated to about 40°C.

10 Example 1

To 3a-(4-(1-chlorobutane)-6a-methylglycoluril (compound 1.7) (1g, 4.2 mmol) suspended in 7M hydrochloric acid (1.27 mL) was added 40% formaldehyde (15 mL) and the mixture stirred at room temperature for 18h. The resultant precipitated diether was collected by filtration washed with water and dried.

Example 2

20 To 3a-(p-iodophenyl)-6a-methylglycoluril (compound 1.2 where X=I) (1g, 1.8 mmol) dissolved in concentrated sulfuric acid (7 mL) was added 40% formaldehyde (1.7 mL) at room temperature. After 20-30 min the mixture was poured into ice water and the precipitated diether was collected by filtration and dried at 80°C *in vacuo*, yield 80%.

Example 3

30 To 3a,6a-diphenylglycoluril (1g, 1.8 mmol) dissolved in concentrated sulfuric acid (7 mL) was added 40% formaldehyde (0.7 mL) at room temperature. After 20-30 min the mixture was poured into ice water and the precipitated diether was collected by filtration and dried at 80°C *in vacuo*, yield 95%.

35 Example 4

To 3a,6a-di(p-iodophenyl)glycoluril (1g, 1.8 mmol) dissolved in concentrated sulfuric acid (6 mL) was added

40% formaldehyde (0.54 mL) at room temperature. After 20-30 min the mixture was poured into ice water and the precipitated diether was collected by filtration and dried at 80°C *in vacuo*.

5

Example 5

3a,6a-cyclopentanoglycoluril (1g, 5.49 mmol) was added to a mixture of dimethylsulfoxide (1 mL), water (2 mL) and 40% formaldehyde (1.6 mL) at room temperature and the pH of the mixture adjusted to 9 with 1 M NaOH. After 12h the mixture was poured into methanol (15 mL) and the precipitated tetrol (compound 2.6) was collected by filtration and dried at 80°C *in vacuo* 82% yield.

15 Example 6

To 3a-(4-but-2-ene)-6a-methylglycoluril (compound 1.3) (1g, 0.48mmol) dissolved in trifluoroacetic acid (2mL) was added 40% formaldehyde (1.46mL) and the mixture heated to 60°C for 12h. Evaporation of the solvent afforded the diether, yield 70%. At short reaction times of less than 1hr a mixture of alcohols and ethers is formed.

Diether analogues of glycoluril can also be prepared under anhydrous conditions, similar to the method of A. Wu, A. Chakraborty, D. Witt, J. Lagona, F. Damkai, M. A. Ofori, J. K. Chiles, J. C. Fettinger, and L. Isaacs *J. Org.Chem.* 2002, 67, 5817-5830, incorporated herein by reference.

(b) *Synthesis of oligomers*

30

Compounds of the formula (2) include oligomers comprising 2 to 10 units of formula (B) linked by bridges of the formula $-CHR^5-$. Such oligomers, and oligomers of the formula (2) as defined above but in which y is 10, can be used as precursors to prepare compounds of formula (1) as described below at "(c) *Synthesis of Compounds of Formula (1)*".

35

Glycoluril analogues can be used to prepare such oligomers. The oligomers can be prepared by mixing one or more glycoluril analogues with an acid, and if required a
5 compound that can form bridges of the formula $-\text{CHR}^5-$ between glycoluril analogues, and heating the mixture. The compound that can form bridges of the formula $-\text{CHR}^5-$ may be trioxane, a compound of the formula R^5COR^5 or a compound of the formula $\text{R}^5\text{OC}(\text{R}^5)_2\text{OR}^5$, wherein R^5 is as
10 defined above and each R^5 is independently selected.

Compounds of formula (2) comprising 2 or more units of the formula (B) linked by bridges of the formula $-\text{CHR}^5-$ can also be reacted with a glycoluril analogue or another
15 compound of formula (2) comprising 2 or more units of the formula (B) linked by bridges of the formula $-\text{CHR}^5-$, under similar conditions to those described above to produce an oligomer containing a greater number of units of the formula (B).

20 The inventors have found that using suitable reaction temperatures and reaction times, oligomers comprising 2 to 11 units of the formula (B) linked by bridges of the formula $-\text{CHR}^5-$ can be prepared without the oligomers
25 reacting to form cucurbiturils. Typically the oligomers are prepared by heating the reaction mixture to a temperature below 50°C for a period of less than about 20 hours. This process typically results in the production of a mixture of oligomers comprising different numbers of
30 units of the formula (B). If desired, an oligomer having a particular length may be separated from the other oligomers in the mixture by crystallisation or chromatography.

35 Certain compounds referred to the following examples are represented by the structures:

2.1 diether dimer

2.2 dimer

2.3 diether dimer

2.4 Trimer

2.5 diether

2.6 tetrol

Example 7

To 3a-isopropylglycoluril (1g, 5.4 mmol) dissolved in trifluoroacetic acid (15 mL) was added 40% formaldehyde (1.62 mL) and the mixture heated at 50°C or reflux for 24h. The solvent was evaporated to give predominantly the dimer (compound 2.3) which was purified or used crude.

10 Example 8

To alkyltethered bisglycoluril (compound 1.11) (500 g, 1.9 mmol) dissolved in trifluoroacetic acid (15 mL) was added

40% formaldehyde (0.855 mL) and the mixture heated at 50°C or reflux for 24h. The solvent was evaporated to give predominantly the dimer which was purified or used crude.

5 Example 9

To 3a-(4-(1-chloro-4-methylbutane)glycoluril (compound 1.6) (1g, 4.2 mmol) dissolved in trifluoroacetic acid (15 mL) was added 40% formaldehyde (1.26 mL) and the mixture heated at 50°C or reflux for 24h. The solvent was
10 evaporated to give the dimer formaldehyde derivative as an ether.

Example 10

The formaldehyde diether derivative of 3a-(4-(1-chloro-4-methylbutane)glycoluril (compound 1.6) (1g, 2.9mmol) and
15 the unsubstituted glycoluril dimer (compound 2.2) (1.8g, 5.8mmol) were mixed together in concentrated HCl (5mL) at room temperature. After 30 mins and up to 1 hr the homogeneous mixture was poured into MeOH (10mL) and the
20 precipitate collected and dried to give predominantly the pentamer.

Example 11

The formaldehyde diether derivative of 3a,6a-
25 diphenylglycoluril (2.9g, 7.7mmol), the unsubstituted glycoluril dimer (compound 2.2) (4.7g, 15.4mmol) and K₂CO₃ (530mg) were mixed together in methanesulfonic acid (40mL) at room temperature, 20 min then 10min at 50°C. The homogeneous mixture was poured into MeOH (60mL) and the
30 precipitate collected and dried to give predominantly the pentamer.

Example 12

The formaldehyde diether derivative (compound 2.5) of
35 dimethylglycoluril (1g, 5.9 mmol) and unsubstituted glycoluril dimer (compound 2.2) (0.91g, 2.95mmol) in conc. HCl (2mL) were stirred together at room temperature for 30

min. to 1hr and the homogeneous mixture was poured into MeOH (10mL) and the precipitate collected and dried to give predominantly the diether tetramer.

5 Example 13

The tetrol derivative (compound 2.6) of 3a,6a-cyclopentanoglycoluril (1g, 3.3mmol) was added to a solution of unsubstituted glycoluril (937mg, 6.6mmol) in conc. HCl (2mL) and the mixture stirred at room
10 temperature for 30 min. The homogeneous mixture was poured into MeOH (10mL) and the precipitate collected and dried to give predominantly the trimer.

Although Examples 7 to 13 concern the preparation of
15 oligomers in which R^3 is =O and R^5 is H in all the units of formula (B) in the oligomer, analogous processes can be used to prepare oligomers where some or all of the R^3 groups are other than =O and/or some or all of the R^5 groups are other than H. For example, oligomers where R^3
20 is other than =O can be prepared using glycoluril analogues where R^3 is other than =O as a starting material. Oligomers where R^5 is other than H can be prepared using analogous processes to those exemplified in Examples 7 to 9 in which a compound of the formula R^5COR^5 where one or
25 both R^5 groups is other than H is used instead of formaldehyde.

(c) *Synthesis of Compounds of Formula (1)*

30 Compounds of formula (2), and oligomers of formula (2) as defined above but in which y is 10, can be used as precursors to prepare compounds of formula (1). This is possible through a variety of reactions such as nucleophilic or electrophilic substitution as single or
35 paired electrons, coupling reactions and condensation reactions. Such reactions can, for example be used to prepare compounds such as compounds 3.1 to 3.6. Similarly,

conventional co-ordination chemistry techniques can also
be used to prepare compounds of the formula (1) in which L
is a metal or comprises a metal and the compound of
formula (1) is a metal complex. Such techniques can for
5 example be used to prepare compounds such as the bis-
phenanthroline glycoluril cobalt co-ordination complex
3.7.

Alternatively linked glycolurils of formula (1) can be
10 prepared directly from a polyketone (eg $R_1\text{COCOR}_2\text{COCOR}_3$ to
give compound 1.11 when R_2 equals $-\text{CHCH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_3\text{CH}-$, R_1
and R_3 equal CH_3 , or compound 1.12 when R_2 equals -
 $\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2-$, R_1 and R_3 equal CH_3 ,) using the reaction
conditions described above for Scheme 1.

3.1

3.2

3.3

3.4

3.5

3.6

3.7

Example 14

A mixture of undecane-2,3,9,10-tetrone or a tetramethoxy acetal (1.4gm) in acidified water pH 1 (0.5mL) (optionally with a cosolvent THF(3mL)) and urea (1.13gm) was stirred at room temperature for several days. The solid linked glycoluril (compound 1.12) was collected by filtration and washed with methanol and dried (1gm).

10

Preparation of compound 3.2. Aqueous 40% formaldehyde (0.7mL) was added to the linked glycoluril (compound 1.12) (0.53gm) suspended in 8M HCl (1.2mL) at ambient temperature. The stirred mixture was maintained at this temperature for 20hr. Methanol (5mL) was added to the homogeneous solution and the precipitate collected by filtration and dried *in vacuo*. The product (compound 3.2, where $n = 1$) was used in the method of the present invention without further purification.

20

2. Formation of Compounds Comprising a Plurality of Cucurbituril Groups

In the following Examples 15 and 16, the "compound 3.2" was the compound 3.2 where $n = 1$ prepared as described in Example 14.

25

Example 15

Compound 3.2 (350mg) was added to a fine suspension of the unsubstituted glycoluril dimer (compound 2.2) (332mg) in HCl 32% (5mL). The mixture was stirred at room temperature for 2h and a gel was formed. Heating the mixture to 95°C for 3hr gave a homogeneous solution. All volatile material was removed *in vacuo* to give a solid product. The solid product contained compounds comprising a plurality of cucurbituril groups.

An alternative procedure, which gave less crosslinking of the polymeric product, was carried out as described below.

Compound 3.2 (350mg) was added to a fine suspension of the unsubstituted glycoluril dimer (compound 2.2) (663mg) in HCl 32% (5mL). The mixture was stirred at room temperature for 2h to give a homogeneous mixture without forming a gel. Then (350mg) of compound 3.2, was added and the mixture heated to 95°C for 3hr, after an initial period of 20 min at room temperature. All volatile material was removed *in vacuo* to give a solid product. This product was insoluble in water and salt solutions. The solid product contained compounds comprising a plurality of cucurbituril groups.

Example 16

Compound 3.2 (350mg), was added to unsubstituted glycoluril (77mg) in HCl 32% (3mL). The mixture was stirred at room temperature for 2h and a gel was formed. Heating the mixture to 95°C for 3hr gave a homogeneous solution. All volatile material was removed *in vacuo* to give a solid product. The solid product contained compounds comprising a plurality of cucurbituril groups.

Further examples of the method of the invention are provided by the following representative reaction schemes:

or

4.2

4.3

4.4

4.5

- The above representative reaction schemes are merely illustrative, and the products depicted are merely illustrative of the manner in which the cucurbituril groups may be linked in some of the compounds produced by the method of the invention.
10. The method of the present invention can be used to prepare compounds containing a plurality of cucurbituril groups. In some embodiments of the invention, the compound produced is a compound comprising a large number of linked cucurbituril groups. Whether the cucurbituril groups in
 - 15 the compounds prepared by the method of the present invention are linked in a linear, branched or cross-linked manner, and the extent of cross linking, depends on the groups A and the Additional Compounds (if any) used and the size of the cucurbituril groups formed. The
 - 20 distribution of sizes of the cucurbituril groups formed can be altered by the presence or absence of a templating compound. Compounds comprising a plurality of cucurbituril groups linked in a manner similar to that illustrated at 4.4 and 4.5 above predominantly occur when
 - 25 the cucurbituril groups formed are cucurbit[6]uril groups.

The compounds comprising a plurality of cucurbituril groups prepared by the method of the present invention can

be used for the same purposes as cucurbiturils as described in WO 00/68232.

5 An advantage of the method of present invention is that the method involves the preparation of compounds containing a plurality of cucurbituril groups without requiring the initial production of cucurbiturils or cucurbituril analogues comprising a single cucurbituril group followed by the subsequent step of linking the
10 cucurbiturils or cucurbituril analogues. This can result in cost and time savings.

In some embodiments, the method of the present invention can be used to prepare compounds comprising a large number
15 of linked cucurbituril groups. Such compounds are large molecules and are therefore typically less liable to being physically washed away by a liquid or gas passing past the compound than a smaller cucurbituril or cucurbituril analogue molecule comprising a single cucurbituril group.
20 Further, in those applications where the compound comprising a plurality of cucurbituril groups is dissolved in a liquid, the high molecular weight of the compound means the compound can, if desired, be conveniently retained in a given environment in the liquid by use of an
25 artificial or biological film or membrane.

In some embodiments, the compound comprising two or more cucurbituril groups produced by the method of the present invention may be shaped or otherwise formed into an
30 article while maintaining the complexing property of the cucurbituril groups. For example, some compounds comprising a plurality of cucurbituril groups may be formed into films or beads. Such films can be used to

partition solutions and gases and the cucurbituril groups on the film are able to selectively capture certain molecules or substances from the solution or gas, thus allowing selective substances to cross the film from one
5 solution or gas to another

It will be appreciated by persons skilled in the art that numerous variations and/or modifications may be made to the invention as shown in the specific embodiments
10 described herein without departing from the spirit or scope of the invention as broadly described. The specific embodiments described or exemplified herein are, therefore, to be considered in all respects as illustrative and not restrictive.

CLAIMS

1. A method for preparing a compound comprising a plurality of cucurbituril groups, the method comprising
5 the steps of:

(a) forming a mixture comprising one or more compounds of the formula (1)

10 A-L-A (1)

wherein

L is a linking group; and
15 each A is independently selected and is a group of the formula (A)

(A)

20

wherein:

for each unit of the formula (B)

25

(B)

in formula (A),

5 R^1 and R^2 may be the same or different, and are each independently selected from a bond with L or a univalent radical, or

10 R^1 , R^2 and the carbon atoms to which they are bound together form an optionally substituted cyclic group, or

R^1 of one unit of the formula (B) and R^2 of an adjacent unit of the formula (B) together form a bond or a divalent radical,

and

15 each R^3 is independently selected from the group consisting of $=O$, $=S$, $=NR'$, $=CXZ$, $=CZR'$, $=CXR''$ and $=CZ_2$, wherein Z is an electron withdrawing group, X is halo, and R' is selected from the group consisting of a bond with L, H, an optionally substituted straight
20 chain, branched or cyclic, saturated or unsaturated hydrocarbon radical, or an optionally substituted heterocyclyl radical, and R'' is a bond with L;

each R^5 is independently selected from the group consisting
25 of H, alkyl and aryl;

R^7 and R^8 may be the same or different and are

independently selected from the group consisting of H and
-CHR⁵OR⁵, or R⁷ and R⁸ together form the group -CHR⁵-O-CHR⁵-
, where each R⁵ is independently selected and is as defined
above;

5

R⁹ and R¹⁰ may be the same or different and are
independently selected from the group consisting of H and
-CHR⁵OR⁵, or R⁹ and R¹⁰ together form the group -CHR⁵-O-CHR⁵-
, where each R⁵ is independently selected and is as defined
as above; and

10

x is 0 or an integer from 1 to 10;
provided that at least one R¹ or R² is a bond with L or at
least one R³ is =NR", =CZR" or =CXR" where R" is a bond with L;
and
an acid; and

15

(b) exposing the mixture to conditions effective for at
least some of the groups A to react to form cucurbituril
groups, wherein at least some of the cucurbituril groups
formed are formed from a group A of one molecule of the
formula (1) and a group A of another molecule of the
formula (1); thereby forming a compound comprising a
plurality of cucurbituril groups.

25

2. A method according to claim 1, wherein the mixture
further comprises one or more compounds selected from
compounds of the formula (6):

30

and compounds of the formula (2):

(2)

wherein:

for each unit of the formula (B):

(B)

in the compound of formula (2)

R¹ and R² may be the same or different, and

10 are each a univalent radical, or

R¹, R² and the carbon atoms to which they are bound together form an optionally substituted cyclic group, or

R¹ of one unit of the formula (B) and R² of an adjacent unit of the formula (B) together form a bond or a divalent radical,

15 and

and

each R³ is independently selected from the group consisting

of =O, =S, =NR, =CXZ, =CRZ or =CZ₂, wherein Z is an electron withdrawing group, X is halo, and R is H, an optionally substituted straight chain, branched or cyclic, saturated or unsaturated hydrocarbon radical, or an
5 optionally substituted heterocyclyl radical;

each R⁵ in formula (2) is independently selected from the group consisting of H, alkyl and aryl;

10 R¹¹ and R¹² may be the same or different and are independently selected from the group consisting of H and -CHR⁵OR⁵, or R¹¹ and R¹² together form the group -CHR⁵-O-CHR⁵-, where each R⁵ is independently selected and is as defined above,

15 R¹³ and R¹⁴ may be the same or different and are independently selected from the group consisting of H and -CHR⁵OR⁵, or R¹³ and R¹⁴ together form the group -CHR⁵-O-CHR⁵-, where each R⁵ is independently selected and is as
20 defined as above; and

y is 0 or an integer from 1 to 9;

and wherein at least some of the cucurbituril groups
25 formed are formed from a group A of one molecule of the formula (1), a group A of at least one other molecule of the formula (1) and one or more molecules of formula (2) or (6).

30 3. A method according to any one of claims 1 or 2, wherein step (b) comprises heating the mixture to a temperature from 20°C to 120°C.

4. A method according to claim 3, wherein step (b)
35 further comprises contacting the compound of formula (1) with a compound that can form bridges of the formula -CHR⁵- between groups A, and between a group A and a compound of

formula (2) or (6).

5. A method according to any one of claims 1 to 4,
wherein L is a divalent organic radical.

5

6. A compound comprising a plurality of cucurbituril
groups produced by the method of any one of claims 1 to 5.
